# **GemBuilder<sup>TM</sup> for Smalltalk/VW Release Notes**

**Version 8.3**

October 2017

## INTELLECTUAL PROPERTY OWNERSHIP

This documentation is furnished for informational use only and is subject to change without notice. GemTalk Systems LLC assumes no responsibility or liability for any errors or inaccuracies that may appear in this documentation.

This documentation, or any part of it, may not be reproduced, displayed, photocopied, transmitted, or otherwise copied in any form or by any means now known or later developed, such as electronic, optical, or mechanical means, without express written authorization from GemTalk Systems.

Warning: This computer program and its documentation are protected by copyright law and international treaties. Any unauthorized copying or distribution of this program, its documentation, or any portion of it, may result in severe civil and criminal penalties, and will be prosecuted under the maximum extent possible under the law.

The software installed in accordance with this documentation is copyrighted and licensed by GemTalk Systems under separate license agreement. This software may only be used pursuant to the terms and conditions of such license agreement. Any other use may be a violation of law.

Use, duplication, or disclosure by the Government is subject to restrictions set forth in the Commercial Software - Restricted Rights clause at 52.227-19 of the Federal Acquisitions Regulations (48 CFR 52.227-19) except that the government agency shall not have the right to disclose this software to support service contractors or their subcontractors without the prior written consent of GemTalk Systems.

This software is provided by GemTalk Systems LLC and contributors "as is" and any expressed or implied warranties, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose are disclaimed. In no event shall GemTalk Systems LLC or any contributors be liable for any direct, indirect, incidental, special, exemplary, or consequential damages (including, but not limited to, procurement of substitute goods or services; loss of use, data, or profits; or business interruption) however caused and on any theory of liability, whether in contract, strict liability, or tort (including negligence or otherwise) arising in any way out of the use of this software, even if advised of the possibility of such damage.

## COPYRIGHTS

This software product, its documentation, and its user interface © 1986-2016 GemTalk Systems LLC. All rights reserved by GemTalk Systems.

## PATENTS

GemStone software is covered by U.S. Patent Number 6,256,637 "Transactional virtual machine architecture", Patent Number 6,360,219 "Object queues with concurrent updating", Patent Number 6,567,905 "Generational garbage collector with persistent object cache", and Patent Number 6,681,226 "Selective pessimistic locking for a concurrently updateable database". GemStone software may also be covered by one or more pending United States patent applications.

## TRADEMARKS

**GemTalk**, **GemStone**, **GemBuilder**, **GemConnect**, and the GemTalk logo are trademarks of GemTalk Systems LLC, or of VMware, Inc., previously of GemStone Systems, Inc., in the United States and other countries.

**UNIX** is a registered trademark of The Open Group in the United States and other countries.

**Solaris**, **Java**, and **Oracle** are trademarks or registered trademarks of Oracle and/or its affiliates. **SPARC** is a registered trademark of SPARC International, Inc.

**Intel** and **Pentium** are registered trademarks of Intel Corporation in the United States and other countries.

**Microsoft**, **Windows**, and **Windows Server** are registered trademarks of Microsoft Corporation in the United States and other countries.

**Linux** is a registered trademark of Linus Torvalds and others.

**Red Hat** and all Red Hat-based trademarks and logos are trademarks or registered trademarks of Red Hat, Inc. in the United States and other countries.

**Ubuntu** is a registered trademark of Canonical Ltd., Inc., in the U.S. and other countries.

**SUSE** is a registered trademark of Novell, Inc. in the United States and other countries.

**AIX**, **POWER6**, **POWER7**, and **POWER8** and **VisualAge** are trademarks or registered trademarks of International Business Machines Corporation.

**Apple**, **Mac**, **MacOS**, and **Macintosh** are trademarks of Apple Inc., in the United States and other countries.

**CINCOM**, **Cincom Smalltalk**, and **VisualWorks** are trademarks or registered trademarks of Cincom Systems, Inc.

Other company or product names mentioned herein may be trademarks or registered trademarks of their respective owners. Trademark specifications are subject to change without notice. GemTalk Systems cannot attest to the accuracy of all trademark information. Use of a term in this documentation should not be regarded as affecting the validity of any trademark or service mark.

# Preface

---

## About This Documentation

These Release Notes describe the changes in the GemBuilder™ for Smalltalk/VW version 8.3 release.

For information on installing or upgrading to this version of GemBuilder for Smalltalk, please refer to the *GemBuilder for Smalltalk Installation Guide* for version 8.3.

For questions or to submit feedback on this manual, join the documentation mailing list: <http://lists.gemtalksystems.com/mailman/listinfo/documentation>.

## Terminology Conventions

The term “GemStone” is used to refer to the server products GemStone/S 64 Bit and GemStone/S, and the GemStone family of products; the GemStone Smalltalk programming language; and may also be used to refer to the company, now GemTalk Systems, previously GemStone Systems, Inc. and a division of VMware, Inc.

## Technical Support

### Support Website

**[gemtalksystems.com](http://gemtalksystems.com)**

GemTalk’s website provides a variety of resources to help you use GemTalk products:

- ▶ **Documentation** for the current and for previous released versions of all GemTalk products, in PDF form.
- ▶ **Product download** for the current and selected recent versions of GemTalk software.

- ▶ **Bugnotes**, identifying performance issues or error conditions that you may encounter when using a GemTalk product.
- ▶ **TechTips**, providing information and instructions that are not in the documentation.
- ▶ **Compatibility matrices**, listing supported platforms for GemTalk product versions.

We recommend checking this site on a regular basis for the latest updates.

## Help Requests

GemTalk Technical Support is limited to customers with current support contracts. Requests for technical assistance may be submitted online (including by email), or by telephone. We recommend you use telephone contact only for urgent requests that require immediate evaluation, such as a production system down. The support website is the preferred way to contact Technical Support.

**Website:** [techsupport.gemtalksystems.com](http://techsupport.gemtalksystems.com)

**Email:** [techsupport@gemtalksystems.com](mailto:techsupport@gemtalksystems.com)

**Telephone:** (800) 243-4772 or (503) 766-4702

Please include the following, in addition to a description of the issue:

- ▶ The versions of GemBuilder for Smalltalk and of all related GemTalk products, and of any other related products, such as client Smalltalk products, and the operating system and version you are using.
- ▶ Exact error message received, if any, including log files and statmonitor data if appropriate.

Technical Support is available from 8am to 5pm Pacific Time, Monday through Friday, excluding GemTalk holidays.

## 24x7 Emergency Technical Support

GemTalk offers, at an additional charge, 24x7 emergency technical support. This support entitles customers to contact us 24 hours a day, 7 days a week, 365 days a year, for issues impacting a production system. For more details, contact GemTalk Support Renewals.

## Training and Consulting

GemTalk Professional Services provide consulting to help you succeed with GemStone products. Training for GemStone/S is available at your location, and training courses are offered periodically at our offices in Beaverton, Oregon. Contact GemTalk Professional Services for more details or to obtain consulting services.

## *Chapter 1. Release Notes for GemBuilder for Smalltalk 8.3*

<i>Supported Platforms and Versions</i>	<b>8</b>
<i>Changes and New Features</i>	<b>9</b>
Support for GemStone/S 64 Bit version 3.4 . . . . .	9
library change on UNIX . . . . .	9
UserProfileGroups . . . . .	9
Single sign on authentication . . . . .	9
Handling of server version mismatch . . . . .	9
Support for VW 8.2.1. . . . .	9
Autocommit did not handle commit failures . . . . .	10
Accessing the server map with unmapped, out of range OOPs. . . . .	10
Image saved with server browser open not cleaned up on VW restart. . . . .	10
Primitive failure when unstubbing for mapped classes of different sizes . . . . .	10
Error when unstubbing an unmapped subclass of Dictionary . . . . .	10
Fatal error that is not a subclass of GbsFatalError was not handled correctly. . .	10
SymbolDictionary issues. . . . .	10
Removing SymbolDictionary did not remove from transient symbol list .	10
SymbolDictionary names that are not proper identifiers. . . . .	11
Inspector changes and bug fixes . . . . .	11
Inspector toolbar includes new button for Refresh From GS Server . . . .	11
Possible walkback when inspecting server object. . . . .	11
Accept in Inspector could perform replication and error . . . . .	11
Spawn Class Hierarchy menu item actually spawned Class Browser . . .	11
Inspectors on Server strings not closed on logout. . . . .	11
Improved printing of sourceCode of GS Basic tab of method inspector . .	11
Dictionary inspector GS Basic tab did not show indexed instance variables	
for empty dictionary . . . . .	12
Debugger changes and bug fixes . . . . .	12

Gbs stack dumps now indicate objects that are immutable . . . . .	12
Debugger > Browse opened Hierarchy Browser rather than Method Browser	12
Debugger receiver pane display changes for stubs . . . . .	12
Debugger single stepping into blocks . . . . .	12
On debugger open, top context is not selected . . . . .	12
In the debugger, executing GS-Debug leaves debugger in stuck state . .	12
Code Browser Issues . . . . .	13
Browser auto-commit icon did not indicate state . . . . .	13
Button to indicate modifications made . . . . .	13
Finding references to class variables found too many references . . . . .	13
Code Browser Instance Variable tab selection and method visibility . . .	13
Error on moving a class to a new undisplayed SymbolDictionary. . . . .	13
Class creation dialog detects invalid arguments . . . . .	13
Server refresh caused reset of selected class in Hierarchy Browser . . . .	13
Browser Control-F dialog could not easily be closed . . . . .	13
Class Versioning in Class Hierarchy and Class Browsers. . . . .	13
Issues related to managing methods . . . . .	14
Autocommit did not commit generated accessor methods . . . . .	14
Browser selection behavior after dragging method between categories . .	14
New methods in category "unknown" . . . . .	14
Dragging a method to a new protocol makes hierarchy browser unusable	14
Browser override/overridden arrows do not distinguish between class and	
instance methods . . . . .	14
Drag and drop a method between browsers . . . . .	14
Deleting method without selected protocol put text pane in incorrect state	15
MNU on commit if a browser referenced a deleted method . . . . .	15
Formatting issues . . . . .	15
Formatting a method that made no changes dirtied source . . . . .	15
Format class definition failed. . . . .	15
Formatting a method with syntax errors did not report errors correctly .	15
User Editor issues . . . . .	15
Unable to create or edit a user with a nil Default Security Policy . . . . .	15
Creating a user changed ownership of the selected security policy . . . .	15
Privilege denied changing default security policy. . . . .	16
Deleting a user with insufficient privileges caused infinite recursion. . .	16
Privileges browser broken under VW 8.x. . . . .	16
Deleting a group. . . . .	16
With multiple sessions, User Browser could get delegate error . . . . .	16
Workspace opened from the GemStone launcher could block the launcher . . .	16
GBS client methods using segment . . . . .	16
Per-thread replication spec issues . . . . .	16
replication spec set could be used in wrong session. . . . .	16
replicationSpecSet confusion within usingReplicationSpecSet:do: block .	17
Per thread replication spec blocks did not nest . . . . .	17
Replication spec failure without object method . . . . .	17

# Release Notes for GemBuilder for Smalltalk 8.3

---

GemBuilder™ for Smalltalk (GBS) version 8.3 is a new version of the GemBuilder for Smalltalk product, adding support for GemStone/S 64 Bit version 3.4 and VW 8.2.1, making many improvements to the tools, and fixing a number of bugs. Please take time to read through these release notes before installing or upgrading, to acquaint yourself with the changes.

These release notes provide changes between the previous version of GBS, version 8.2, and version 8.3.

If you are upgrading from a version prior to 8.2, please also review the release notes for each intermediate release between your version and 8.3, to see the full set of changes.

This release supports both GemStone/S 64 Bit, the 64-bit GemStone/S-based object server, and with GemStone/S, the original 32-bit GemStone object server.

GBS v8.3 is supported with VisualWorks 7.10.1 and 8.x, and cannot be used with VisualWorks versions earlier than 7.9, nor with VA Smalltalk.

To install GemBuilder for Smalltalk 8.3, follow the instructions in the *GemBuilder for Smalltalk Installation Guide* for version 8.3.

## Supported Platforms and Versions

The following tables describe the client Smalltalk versions and platforms supported by GBS 8.3, and the GemStone server product shared library versions that can be used with each.

For more details, including the specific required client libraries for each server product and versions, refer to the *GemBuilder for Smalltalk Installation Guide* for version 8.3.

**Table 1 Supported GemStone/S 64 Bit Server versions**

	VW 8.2.1 32-bit and 64 bit	VW 8.1.1 32-bit	VW 7.10.1 32-bit	VW 7.10.1 64-bit
<b>Windows 10</b>	3.4, 3.3.6		3.4, 3.3.6	3.4
<b>Windows 8</b>	3.4, 3.3.6	3.3.6	3.4, 3.3.6	
<b>Windows 2008 R2</b>	3.4, 3.3.6	3.3.6	3.4, 3.3.6	
<b>Windows 7</b>	3.4, 3.3.6	3.3.6, 3.2.17	3.4, 3.3.6, 3.2.17	3.3.6
<b>Ubuntu Linux 16.04</b>	3.4, 3.3.6		3.4, 3.3.6	
<b>Ubuntu Linux 14.04</b>	3.4, 3.3.6	3.3.6, 3.2.17	3.4, 3.3.6, 3.2.17	
<b>Red Hat Linux ES 7.1</b>	3.4, 3.3.6		3.4, 3.3.6	3.4
<b>Red Hat Linux ES 6.7</b>	3.4, 3.3.6	3.3.6, 3.2.17	3.4, 3.3.6, 3.2.17	3.3.6

**Table 2 Supported 32-bit GemStone/S Server versions**

	VW 7.10.1 32-bit
<b>Windows 2008 R2</b>	6.7
<b>Windows 7</b>	6.7
<b>Red Hat Linux ES 6.5</b>	6.7

## Changes and New Features

The following changes are in version 8.3:

### Support for GemStone/S 64 Bit version 3.4

Support for the latest version of the GemStone/S 64 Bit server, v3.4, has been added. If you are upgrading to v3.4 as well, please read through the Release Notes for v3.4 for changes that impact your GBS application.

#### library change on UNIX

Previously, the required client libraries included, in addition to libgcirpc\* or libgcilnk\*, the shared library libssl\*. With the addition of new open source products, this has been changed, and the new library name is **libfloss** (floss stands for Free/Libre Open Source Software). libfloss include the openssl shared library, as well as LDAP and Kerberos.

This does not apply to clients on Windows, which continue to require the same set of libraries.

#### UserProfileGroups

A UserProfile's groups are now collections of UserProfileGroup, rather than strings. The API for managing users has been updated to handle these objects.

#### Single sign on authentication

Note that v3.4 supports Single-sign on, using Kerberos. Users can authenticate using this mechanism. However, the User Tools in GBS do not support configuring this authentication or creating KerberosPrincipals. To configure single sign on, you must execute the server code following the instructions in the GemStone/S 64 Bit System Administration Guide or the 3.4 Release Notes.

#### Handling of server version mismatch

When the v3.4 libraries contact the NetLDI, they now make a secure connection. This creates a protocol error if an image using the 3.4 libraries are incorrectly configured to connect to a NetLDI running an earlier version of GemStone. Likewise, an error is encountered when earlier libraries from earlier versions are used to connect to a 3.4 NetLDI.

Note that if logins encounter error with messages such as: 'SSL configuration mismatch' or 'Invalid flags value from peer', it is likely to indicate a version mismatch.

### Support for VW 8.2.1

Support for VisualWorks version 8.2.1 has been added. The GBS 8.3 distribution includes an additional parcel, GbsToolsVw821, that is automatically loaded when loading detects a VW 8.2.1 image.

## Autocommit did not handle commit failures

With autocommit on, a commit failure, such as a commit conflict between multiple sessions, resulted in a walkback, MNU on #description. (#46747)

## Accessing the server map with unmapped, out of range OOPs

Attempting to remove the mapping of an object that was not previously mapped and was larger than the current map size resulted in a subscript out of bounds error. Now, this will do nothing. (#46791)

## Image saved with server browser open not cleaned up on VW restart

When the image was saved when there were logged in sessions with open browsers, on VW, these sessions are normally cleaned up. It was possible for the cleanup on restart to be bypassed, and the event detectors for the open browsers to run, which resulted in a walkback. (#46572)

## Primitive failure when unstubbing for mapped classes of different sizes

If an application uses automatic name-matching class mapping for a subclass of OrderedCollection, and these OrderedCollection subclasses have unmatched named instance variables, unstubbing of instance with fewer unnamed instance variables can fail.

The problem is when the class on the client more named instance variables than the class with the same name on the server, and a stub is created for an instance with fewer elements than number of instance variables, before the classes are mapped. The attempt to change the class of the stub fails since the stub is too small to accommodate the named instance variables. (#46781)

## Error when unstubbing an unmapped subclass of Dictionary

When an instance of a subclass of Dictionary that is not mapped is unstubbed, it reported an unstub error. (#46785)

## Fatal error that is not a subclass of GbsFatalError was not handled correctly.

The error detector should be shut down if a fatal error occurs. If the fatal error was not a subclass of GbsFatalError, this code raised an error. (#46971)

## SymbolDictionary issues

### Removing SymbolDictionary did not remove from transient symbol list

When a SymbolDictionary was removed from the SymbolList, it was removed from the persistent but not the transient SymbolLists. This resulted in incorrect behaviors in resolution of symbols associated with that SymbolDictionary for the remainder of the session. (#46859)

## **SymbolDictionary names that are not proper identifiers**

Identifiers in the Smalltalk sense contain only alphanumeric characters and underscore, and start with a letter. While usually SymbolDictionary names are identifiers, it is legal to use any Symbol. Non-identifier Symbols require quoting and resolution as an expression within the class definition expression, and make some tools usage within GemStone more awkward; using non-identifier Symbols as SymbolDictionary names is discouraged.

GBS continues to allow such non-identifier symbol names for SymbolDictionaries. Now, when you attempt to create a new Symbol dictionary with a name that is not an identifier, you get a dialog confirming that this is not an identifier.

The GBS tools fully support using non-identifier SymbolDictionary names; a few issues have been fixed in v8.3. (#44924, #47105)

## **Inspector changes and bug fixes**

### **Inspector toolbar includes new button for Refresh From GS Server**

The toolbar pane on Inspectors now includes a new button to perform the operation **Refresh From GS Server**. This function is also on the **Object** menu.

Note that the position of this item on the menu has changed.

### **Possible walkback when inspecting server object**

There were cases where the inspector computations could validly attempt to set the tab more than once, which was handled as if it was a recursive call. (#46907)

### **Accept in Inspector could perform replication and error**

When inspecting an Array and accepting changes in an element, it was possible to attempt to create a client class and encounter a block replication error. (#47034)

### **Spawn Class Hierarchy menu item actually spawned Class Browser**

With VW 8.x, the Inspector GsElements tab has a pop-up menu item Spawn Class Hierarchy. This spawned a Class Browser (#47143)

### **Inspectors on Server strings not closed on logout**

On logout, open inspectors on server strings remained open, but became inspectors on the client immutable ByteString 'Not cached', which had to be manually closed. (#46480)

### **Improved printing of sourceCode of GS Basic tab of method inspector**

Server method inspectors sometimes included the GS Basic tab field *sourceCode*. When present, this included associated delegate information, which was unnecessary. Now the *sourceCode* field is always provided and the delegate information is not included. (#46810)

## Dictionary inspector GS Basic tab did not show indexed instance variables for empty dictionary

The GS Basic tab of an inspector should display the named and indexed instance variables. For inspectors on empty instance of kinds of Dictionary that were created with empty slots and have no contents, the indexed instance variable slots were not displayed. (#46783)

## Debugger changes and bug fixes

### Gbs stack dumps now indicate objects that are immutable

If a client object is immutable, the GBS stack dump output will include '(immutable)' (#46777)

### Debugger > Browse opened Hierarchy Browser rather than Method Browser

The debugger menu item **Method > Browse** opened a Class Hierarchy Browser rather than a Method Browser. (#46435)

### Debugger receiver pane display changes for stubs

When debugging a stub, previously the receiver pane included entries for `.proxy` (the stub itself), `.delegate` (the delegate for the server object), and `self` (the server object that is stubbed).

The names and ordering for `self` and `.proxy` have changed to be more intuitively correct. Now, the top entry is labeled `self` (since it represents the receiver), and the server object is now labeled `.server`.

### Debugger single stepping into blocks

When single stepping to a block and through the code in a block, the values on the stack were incorrectly listed in the temporaries inspector panes. ((#46692)

With some server versions, when single stepping through the code within the block, the highlight of the currently selected step point failed, so selection remained at the start of the method. (#47088)

### On debugger open, top context is not selected

*VW 8.x only*

When a debugger is open, normally the first context is selected and the current codepoint highlighted. With VW 8.x, the first context was displayed grayed out, and no context was selected. (#46543)

### In the debugger, executing GS-Debug leaves debugger in stuck state

*VW 8.x only*

In a debugger, attempting to execute code using GS-Debug it resulted in a walkback, Message not understood: #gbxIsServerContext. This error leaves the debugger state such that the debugger does not respond to close. (#46610)

## Code Browser Issues

### Browser auto-commit icon did not indicate state

Under VisualWorks 8.x, there was no visual difference indicating the state of autocommit. (#46434)

### Button to indicate modifications made

*VW 8.x only*

In code browsers, the Source, Definition, Hierarchy and Comment tabs now have indicators that turn red when there are unsaved edits in the text. These indicators were present under VW 7.10.1, but missing with VW 8.x. (#46544)

### Finding references to class variables found too many references

The Code browser's **Class** menu item **Browse References > To A Class Variable** found all references to class variables with the given name, not just the references from the selected class. (#46563)

### Code Browser Instance Variable tab selection and method visibility

In a System, Class, or Hierarchy Browser, the Instance Variable tab can be used to select methods that reference a particular instance variable. Now, when no instance variable is selected, all methods are displayed. Also, when a method is edited, the instance variable remains selected unless the new method no longer references the instance variable. (#46789)

### Error on moving a class to a new undisplayed SymbolDictionary

If a SymbolDictionary was created but a browser was not updated to make this visible, moving a class to this SymbolDictionary reported an Element not found error in attempting to set the selection. (#46843)

### Class creation dialog detects invalid arguments

If you use the class creation dialog and the classname is empty, or the superclass is not a Behavior, it now inlines appropriate error messages into the incorrect entry. (#45667)

### Server refresh caused reset of selected class in Hierarchy Browser

When you commit, abort, or refresh from server, the selected class in the Hierarchy Browser was changed to the class that the browser was originally opened on, regardless of the currently selected class. (#46579)

### Browser Control-F dialog could not easily be closed

The find class dialog created using control-F did not respond to cancel. (#46361)

### Class Versioning in Class Hierarchy and Class Browsers

The Class Hierarchy and Class Browsers can be used to modify a class definition, by changing superclass or by adding and removing instance variables. These changes create

a new version of the class and recompile subclasses. The display of the class definition was not always updated, leaving the older version of the class visible, and in some cases a new browser opened on the modified class version. (#46724, #43046. #46724 )

When you file in code that defines a class that already exists, such that a new version of the class is created, it does not automatically recompile the subclasses of this class, so the superclass remains the older version. The Hierarchy Browser, however, reported that the superclass of the class is the new version, and displays the new version of the superclass. If the protocol This can be confusing if the protocol in the superclass is different, since methods in the new superclass version will not be understood. (#45694)

## Issues related to managing methods

### **Autocommit did not commit generated accessor methods**

When accessor methods were created using the menu item **Create Accessors...**, the generated accessor methods were not committed automatically. (#46540)

### **Browser selection behavior after dragging method between categories**

When dragging and dropped a method from one method category to another, previously selection moved to the new category. Now, the currently selected category remains selected; no method is selected, since the moved method is no longer in this category.

### **New methods in category "unknown"**

When a new method is created by editing an existing method when a category is not selected, it would put this method into a category "unknown", rather than the category of the existing method. Now, if a method is selected, it will use this method's category for the new method's category. (#46746)

### **Dragging a method to a new protocol makes hierarchy browser unusable**

If the hierarchy browser is opened on a class, and a subclass of that class is selected and a method dragging between categories, and the superclass has fewer protocols than the class in which the method was moved, it results in a subscript out of bounds error. The browser is no longer usable and must be closed. (#46580)

### **Browser override/overridden arrows do not distinguish between class and instance methods**

Browsers use up and down arrows to distinguish methods that override one inherited from a superclass, or that are implemented by a subclass. This did not distinguish between class and instance methods, so the arrows could be incorrect. (#46617)

### **Drag and drop a method between browsers**

Attempting to select and drag a method from one browser to a different class in a separate browser resulted in an error, MNU on #proxy. This is now supported functionality. (#46556 )

### **Deleting method without selected protocol put text pane in incorrect state**

If no protocol is selected and a method is deleted, the text pane displayed the class definition but the selected tab was Source, not Definition. Attempting to edit the definition and accept encountered unexpected token errors. (#46586)

### **MNU on commit if a browser referenced a deleted method**

Deleting a method that was selected in another browser created a number of issues.

Subsequent commits or aborts would throw an exception while updating the open browsers, after they completed successfully. (#44374, 46587).

Now, deleted methods are no longer red italic; the text <<removed>> is appended to the selected item in the browser.

## **Formatting issues**

### **Formatting a method that made no changes dirtied source**

If you format a method but the formatting made no changes, the method was marked dirty. (#46571)

### **Format class definition failed**

The control-O option to format a method was not disabled for class definitions, and inserted errors in the definition text. Control-O can now only be used when the source tab is selected. (#46568)

### **Formatting a method with syntax errors did not report errors correctly**

When a method containing syntax errors was formatted, the syntax error message was inserted in the wrong place and the entire method, not just the error, was selected. (#46633)

## **User Editor issues**

### **Unable to create or edit a user with a nil Default Security Policy**

GS64 allows nil object security policies, meaning that objects do not have object-level access control, and users may have their default object security policy nil to indicate this.

The user tool did not support this; nil was treated as the string 'nil', and a user security policy created with the name nil. This was made the default security policy for the user, which could have left this user unable to login.

This occurred when attempting to create a new user with a nil security policy, or on making any edit, not just to the security policy, to an existing user. (#47069, #45207, #45199)

### **Creating a user changed ownership of the selected security policy**

When a user is created using the user dialog, a default object security policy must be selected. The ownership of that security policy was set to the new user. (#45392)

### **Privilege denied changing default security policy**

Only members of the DataCuratorGroup could change a user's default object security policy; the privilege was not sufficient. (#45392)

### **Deleting a user with insufficient privileges caused infinite recursion**

Using the User Browser to delete a user by a user that had the incorrect privileges was not detected, so encountered infinite recursion. (#46595)

### **Privileges browser broken under VW 8.x**

Attempting to open the privileges browser in VisualWorks 8.1.1 encountered an MNU. (#46483)

### **Deleting a group**

The User Editor browser has the ability to create groups, but previously did not support removing a group. The feature is now available by right-click in either groups list. (#47097)

### **With multiple sessions, User Browser could get delegate error**

The User Browser did not respect the distinction between the selected session and the current session, and could get error "Attempt to use a delegate from another session". (#46832)

## **Workspace opened from the GemStone launcher could block the launcher**

A workspace opened from the GemStone Launcher shared the same WindowManager as the launcher. Performing long operations in the workspace blocked activity on the Launcher. (#46865)

## **GBS client methods using segment**

In GemStone/S 64 Bit, 'segments' were renamed to 'objectSecurityPolicies' to reflect their actual function. Methods that reference 'segment' are supported but deprecated. (#46466)

In GBS v8.3, Object extension methods have been updated:

- ▶ Object >> changeToSegment: and Object >> assignToSegment: are deprecated when running with GS64 3.x
- ▶ Object >> gbsObjectSecurityPolicy: added, only for use with GS64 3.x

## **Per-thread replication spec issues**

### **replication spec set could be used in wrong session**

There were code paths in which the per-thread replication specs intended for one session were used in a different session, or in a later session with a matching session number as the original session. (#47055)

## **replicationSpecSet confusion within usingReplicationSpecSet:do: block**

While in a `usingReplicationSpecSet:do: block`,  
`GbsSession>>replicationSpecSet` answered the thread-specific spec set for the block, rather than the global spec set for the session. (#47065)

## **Per thread replication spec blocks did not nest**

Per-thread replication specs, configured with `usingReplicationSpecSet:do:` encountered errors if you attempted to nest the blocks. (#46763)

## **Replication spec failure without object method**

If a thread-safe replication spec is defined, but there is no method defined on `Object` class for that symbol, or if the method was removed, it results in a walkback and possible errors that are difficult to diagnose, and the image did not reliably cleanup the environment afterwards. (#46754, #46758, #46765, #47115)

Now, if a method in `Object` class is deleted whose selector corresponds to a replication spec set that has been used in any currently-logged-in session, a `Warning` will be signaled. A `Warning` will, unless caught, open a dialog.
