Any unauthorized copying or distribution of this program, its documentation, or any portion of it, may result in severe civil and criminal penalties, and will be prosecuted under the maximum extent possible under the law.

The software installed in accordance with this documentation is copyrighted and licensed by GemTalk Systems under separate license agreement. This software may only be used pursuant to the terms and conditions of such license agreement. Any other use may be a violation of law.

Use, duplication, or disclosure by the Government is subject to restrictions set forth in the Commercial Software - Restricted Rights clause at 52.227-19 of the Federal Acquisitions Regulations (48 CFR 52.227-19) except that the government agency shall not have the right to disclose this software to support service contractors or their subcontractors without the prior written consent of GemTalk Systems.

This software is provided by GemTalk Systems LLC and contributors "as is" and any expressed or implied warranties, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose are disclaimed. In no event shall GemTalk Systems LLC or any contributors be liable for any direct, indirect, incidental, special, exemplary, or consequential damages (including, but not limited to, procurement of substitute goods or services; loss of use, data, or profits; or business interruption) however caused and on any theory of liability, whether in contract, strict liability, or tort (including negligence or otherwise) arising in any way out of the use of this software, even if advised of the possibility of such damage.

COPYRIGHTS

This software product, its documentation, and its user interface © 1986-2020 GemTalk Systems LLC. All rights reserved by GemTalk Systems.

PATENTS

GemStone software is or has been covered by U.S. Patent Number 6,256,637 "Transactional virtual machine architecture" (1998-2018), Patent Number 6,360,219 "Object queues with concurrent updating" (1998-2018), Patent Number 6,567,905 "Generational garbage collector with persistent object cache" (2001-2021), and Patent Number 6,681,226 "Selective pessimistic locking for a concurrently updateable database" (2001-2021).

TRADEMARKS

GemTalk, **GemStone**, **GemBuilder**, **GemConnect**, and the GemTalk logo are trademarks of GemTalk Systems LLC, or of VMware, Inc., previously of GemStone Systems, Inc., in the United States and other countries.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Solaris, **Java**, and **Oracle** are trademarks or registered trademarks of Oracle and/or its affiliates. **SPARC** is a registered trademark of SPARC International, Inc.

Intel and **Pentium** are registered trademarks of Intel Corporation in the United States and other countries.

Microsoft, **Windows**, and **Windows Server** are registered trademarks of Microsoft Corporation in the United States and other countries.

Linux is a registered trademark of Linus Torvalds and others.

Red Hat and all Red Hat-based trademarks and logos are trademarks or registered trademarks of Red Hat, Inc. in the United States and other countries.

Ubuntu is a registered trademark of Canonical Ltd., Inc., in the U.S. and other countries.

SUSE is a registered trademark of Novell, Inc. in the United States and other countries.

AIX, **POWER6**, **POWER7**, **POWER8** and **VisualAge** are trademarks or registered trademarks of International Business Machines Corporation.

Apple, **Mac**, **MacOS**, and **Macintosh** are trademarks of Apple Inc., in the United States and other countries.

CINCOM, **Cincom Smalltalk**, and **VisualWorks** are trademarks or registered trademarks of Cincom Systems, Inc.

Raspberry Pi is a trademark of the Raspberry Pi Foundation

Other company or product names mentioned herein may be trademarks or registered trademarks of their respective owners. Trademark specifications are subject to change without notice. GemTalk Systems cannot attest to the accuracy of all trademark information. Use of a term in this documentation should not be regarded as affecting the validity of any trademark or service mark.

Preface

About This Documentation

These release notes describe changes in the GemStone/S 64 Bit™ version 3.4.5 release. Read these release notes carefully before you begin installation, upgrade, or development with this release.

No separate Installation Guide is provided with this release. For instructions on installing GemStone/S 64 Bit version 3.4.5, or upgrading or converting from previous products or versions, see the Installation Guide for version 3.4.

Terminology Conventions

The term “GemStone” is used to refer to the server products GemStone/S 64 Bit and GemStone/S, and the GemStone family of products; the GemStone Smalltalk programming language; and may also be used to refer to the company, now GemTalk Systems LLC, previously GemStone Systems, Inc. and a division of VMware, Inc.

Technical Support

Support Website

gemtalksystems.com

GemTalk’s website provides a variety of resources to help you use GemTalk products:

- ▶ **Documentation** for the current and for previous released versions of all GemTalk products, in PDF form.
- ▶ **Product download** for the current and selected recent versions of GemTalk software.

- ▶ **Bugnotes**, identifying performance issues or error conditions that you may encounter when using a GemTalk product.
- ▶ **Supplemental Documentation** and **TechTips**, providing information and instructions that are not in the regular documentation.
- ▶ **Compatibility matrices**, listing supported platforms for GemTalk product versions.

We recommend checking this site on a regular basis for the latest updates.

Help Requests

GemTalk Technical Support is limited to customers with current support contracts. GemStone users that do not have support contracts may post issues on the customer forum. To join this list, visit lists.gemtalksystems.com/mailman/listinfo/gemstone-smalltalk.

Requests for technical assistance can be submitted online or by email. Telephone support is available but should be limited to urgent requests that require immediate assistance, such as a production system down.

Website: techsupport.gemtalksystems.com

Email: techsupport@gemtalksystems.com

Telephone: (800) 243-4772 or (503) 766-4702

Please include the following, in addition to a description of the issue:

- ▶ The versions of GemStone/S 64 Bit and of all related GemTalk products, and of any other related products, such as client Smalltalk products, and the operating system and version you are using.
- ▶ Exact error message received, if any, including log files and statmonitor data if appropriate.

Technical Support is available from 8am to 5pm Pacific Time, Monday through Friday, excluding GemTalk holidays.

24x7 Emergency Technical Support

GemTalk offers, at an additional charge, 24x7 emergency technical support. This support entitles customers to contact us 24 hours a day, 7 days a week, 365 days a year, for issues impacting a production system. For more details, contact GemTalk Support Renewals.

Training and Consulting

GemTalk Professional Services provide consulting to help you succeed with GemStone products. Training for GemStone/S is available at your location, and training courses are offered periodically at our offices in Beaverton, Oregon. Contact GemTalk Professional Services for more details or to obtain consulting services.

GemStone/S 64 Bit 3.4.5 Release Notes

Overview

GemStone/S 64 Bit™ 3.4.5 is a maintenance release of the GemStone/S 64 Bit object server. This release includes several feature enhancements and fixes a number of bugs.

We recommend everyone using GemStone/S 64 Bit upgrade to the latest version, currently v3.5.1. The v3.4.5 release provides bug fixes and enhancements to customers who are not yet able to upgrade to v3.5.1 or later.

These release notes describe changes between the previous version of GemStone/S 64 Bit, version 3.4.4, and version 3.4.5. If you are upgrading from a version prior to 3.4.4, review the release notes for each intermediate release to see the full set of changes.

The Installation Guide has not been updated for this release. For installation, upgrade and conversion instructions, use the Installation Guide for version 3.4.

Supported Platforms

Platforms for Version 3.4.5

GemStone/S 64 Bit version 3.4.5 is supported on the following platforms:

- ▶ Red Hat Enterprise Linux Server 6.9 and 7.4, and Ubuntu 16.04 and 18.04, and SUSE Linux Enterprise 12, on x86. Testing has been done on some earlier Red Hat Enterprise Linux Server 6.x and 7.x versions with the latest security patches.
- ▶ Solaris 10 and 11.4 on x86
- ▶ AIX 6.1, 7.1, and 7.2
- ▶ OS X 10.14.3 (Mojave) with Darwin 18.2.0 kernel, on x86 (Mac is supported for development only)

For more information and detailed requirements for each supported platforms, please refer to the GemStone/S 64 Bit v3.4 Installation Guide for that platform.

GemBuilder for Smalltalk (GBS) Versions

GemStone/S 64 Bit version 3.4.5 requires GBS version 8.3 or later for VisualWorks Smalltalk, or version 5.4.4 or later for VA Smalltalk.

The following versions of GBS are supported with GemStone/S 64 Bit version 3.4.5:

GBS version 8.4

| VisualWorks 8.3.2 32-bit and 64-bit | VisualWorks 7.10.1 32-bit | VisualWorks 7.10.1 64-bit |
|---------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> ▶ Windows 10 and Windows 7 ▶ RedHat ES 7.4 and 6.9; Ubuntu 18.04 and 16.04 | <ul style="list-style-type: none"> ▶ Windows 10 and Windows 7 ▶ RedHat ES 7.4 and 6.9; Ubuntu 16.04 | <ul style="list-style-type: none"> ▶ Windows 10 ▶ RedHat ES 7.4 and 6.9 |

GBS version 8.3

| VisualWorks 8.2.1 32-bit and 64-bit | VisualWorks 7.10.1 32-bit | VisualWorks 7.10.1 64-bit |
|-----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> ▶ Windows 10 and Windows 7 ▶ RedHat ES 7.4 and 6.9; Ubuntu 16.04 | <ul style="list-style-type: none"> ▶ Windows 10 and Windows 7 ▶ RedHat ES 7.4 and 6.9; Ubuntu 16.04 | <ul style="list-style-type: none"> ▶ Windows 10 ▶ RedHat ES 7.4 and 6.9 |

GBS version 5.4.5

| VA Smalltalk 9.1 | VA Smalltalk 8.6.3 |
|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> ▶ Windows 10 | <ul style="list-style-type: none"> ▶ Windows 10 ▶ Windows 7, Professional or above |

GBS version 5.4.4

| VA Smalltalk 8.6.3 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> ▶ Windows 10 ▶ Windows 8.1, Professional or above ▶ Windows 7, Professional or above |

Note that Windows 7 reached end of life as of January of 2020. While GemTalk will continue to support GemStone clients on Windows 7, it will no longer be considered certified.

For more details on supported GBS and client Smalltalk platforms and requirements, see the *GemBuilder for Smalltalk Installation Guide* for that version of GBS.

VSD Version

The GemStone/S 64 Bit v3.4.5 distribution includes VSD version 5.4.2. The previous version of GemStone/S, v3.4.4, included VSD v5.4. (VSD v5.4.1 was a limited distribution release; all changes are included in v5.4.2).

VSD version 5.4.2 is a maintenance release, including a few bug fixes. For details on the changes, see the [Release Notes for VSD v5.4.2](#).

VSD versions are not tied to GemStone server versions: both older and newer versions of VSD can be used to read statmonitor files generated by both older and newer versions of GemStone/S and GemStone/S 64 Bit.

Changes in this release

Updated library versions

- ▶ The version of OpenSSL has been updated to 1.1.1d.
- ▶ The version of lz4 has been updated to v1.9.2

Recommendation to clear `/opt/gemstone/locks/` on system restart

If there is an unexpected shutdown, the lock files (*filename*.LCK) for GemStone processes such as Stone and cache remain in the `/opt/gemstone/locks/` directory. These lock files include the PID and other information that is used to determine process status.

On restart, it is possible for kernel processes to reuse this PID. If the owner is root, GemStone cannot reliably determine the status of the process and thus cannot safely delete the lock file. These lock files must be manually deleted.

It is recommended that systems should be setup so that on boot, the lock files in `/opt/gemstone/locks/*.LCK` are deleted automatically on system restart.

Do not delete `/opt/gemstone/locks/gemstone.hostid`, which is in the same directory.

Reporting on transaction conflicts

The following methods have also been added, providing the important details of commit conflict in a readable string. Each line includes the conflict kind and the conflict objects.

```
System class >> conflictReportString
  Return a String summarizing the results of System class >>
  transactionConflicts.
```

```
System class >> conflictReportString: conflicts
  The conflicts argument is Array returned by System class >>
  transactionConflicts. The report is limited to the first 100 oops in each
  category of conflict.
```

For example,

```
topaz 1> run
System conflictReportString
%
1 Write-Write Conflicts( 10528769(a SymbolDictionary))
```

Ability to terminate a GsHostProcess

The following methods have been added to programmatically terminate a running GsHostProcess:

```
GsHostProcess >> killChild
    Terminate a GsHostProcess process that is running.

GsHostProcess >> killChild: timeout
    Wait for the specified timeout and if the GsHostProcess child process is still
    running, terminate it.
```

gslist output in json format

gslist has added the **-j** argument, which returns information about running GemStone processes comparable to the **gslist -x** output, in json format.

For example:

```
unix> gslist -j -n gs64stone
{"GemStoneServers": [
  {
    "Name": "gs64stone",
    "Host": "benton",
    "HostId": "69621bb0476b1938",
    "Ip": "10.94.141.12",
    "Status": "Exists",
    "Type": "Stone",
    "Version": "3.4.5",
    "Creator": "gsadmin",
    "Started": "2020-01-13T16:08:00.000-07:00",
    "Pid": 29010,
    "Port": 35043,
    "Options": {},
    "LogName": "/users/gsadmin/345/data/gs64stone.log",
    "Sysconf": "/users/gsadmin/345/data/system.conf",
    "Execonf": null,
    "GEMSTONE": "/users/gsadmin/345",
    "Exe": "/users/gsadmin/345/sys/stoned"
  }
]}
```

This can be easily processed as needed for system administration. For example:

```
(JsonParser new parse: (System performOnServer: 'gslist -j'))
```

creates a structure of Dictionaries and Arrays in GemStone Smalltalk containing all information about all GemStone services.

Note that all keys and values in the output are capitalized. This includes **gslist** status values (such as 'Exists'), and command line arguments.

copydbf -i/-I of extent file now includes version

A line has been added to the **copydbf -i/-I** output for an extent file, providing the version number of the extent.

Further details for failures in network handshake

Errors in the NetSAccept/NetSConnect handshake can now be configured to print additional diagnostic information.

To enable detailed printing of socket failures during login, set the environment variable:

```
export GS_DEBUG_LOGIN=1
```

before **startnetldi**. For GCI clients with a console, it is recommended that this also be set in that environment before starting the client.

Bug Fixes

The following bugs that were present in v3.4.4 are fixed in this version.

Performance issue

The AIO pgsvr made several calls to `HostGetNanoTime()` within its loop. These calls put load on the CPU and impacted performance. (#48503)

Reduced-conflict objects not handled correctly in nested transactions

Reduced Conflict (RC) objects (such as `RcKeyValueDictionary`, etc.) maintain changes in a redo log that allows a commit conflict to be resolved by replay. However, when an RC object was modified within a nested transaction, and that nested transaction was aborted, the redo log was not updated. If later, the RC object has further changes, and the commit again has conflicts such that the redo log is replayed, the changes that had been made earlier and aborted may be applied. (#48389)

Terminated GsProcess may not have allowed ensure block to complete

When sending `terminate` to a `GsProcess` that is executing an `ensure` block, there is a risk that the timeout may expire before the `ensure` block completes.

The timeout in `GsProcess>>terminate` has been raised from 10 to 30 seconds to reduce the risk of this problem. (#48271)

GCI client on Windows 7 hang on socket disconnect

A GCI client (including RPC GBS and topaz) on Windows 7 may hang when a socket is killed and the Gem exits. This is related to that OS version's socket library returning `EWOULDBLOCK`, which otherwise implies data on the socket. The GCI client code now recognizes this condition and will terminate the connection. (#48448)

Removing dynamic instance variable from large SequenceableCollection

Removing a dynamic instance variable from an instance of a subclass of `SequenceableCollection` (such as `Array`, `OrderedCollection`, or `String`), that is a `Large` object (that is, a pointer size larger than 2K or a byte size larger than 16K), causes the size to become incorrectly very large. (#48506)

Stuck hash table lock in remote cache

It was possible for an attempt to remove an old lifetime of a page in a remote cache to result in a stuck hash table lock. (#48453)

Find reference path search missed references via class instance variables

If the only reference to an object was via a class instance variable, and the class itself was not in any user's SymbolDictionaries, the object could be incorrectly reported as unreachable/dead. (#48447)

Hot standby issues

Adjustments to debug logging output

The hotstandby processes, logreceiver and logsender, print some information to their log files. Starting in v3.4.2, to reduce clutter in the logs, some of these output statements are only printed when debugging is enabled. Debugging is enabled using the startlogreceiver/startlogsender utility argument -d. Some log messages now printed only in debug mode were still prefixed with [Info]. In addition, flush records are printed to the log in regular as well as debug mode. (#48484)

continuousRestoreFromArchiveLogs could fail on initial setup

When setting up a new a hot standby system, the final steps are to run **startlogreceiver**, and then to execute `continuousRestoreFromArchiveLogs`: on the slave system. However, it takes a few seconds after executing **startlogreceiver** before the tranlogs are available on the slave system. If `continuousRestoreFromArchiveLogs`: is executed immediately after the **startlogreceiver** is started up, before any logs were available, it failed with a file not found error. (#48346)

GsBitmap issues

GsBitmap did not correctly handle some cases with large objects

Some GsBitmap methods to find references did not correctly handle cases of references through NSCs or LargeObjectNode, and errored. Specifically, finding references paths using GsSingleRefPathFinder could error. (#48445)

Printing a very large GsBitmap

GsBitmap >> printOn: did not limit the amount printed. For very large GsBitmaps, the print operation failed. (#48443)

DecimalFloat >> asStringUsingFormat: did not 0-pad per argument

The arguments to `asStringUsingFormat`: include the number of digits to include following the decimal point. While DecimalFloat rounded if there were more digits, it did not pad with 0 as documented to the minimum number of digits. (#48305)

GciNewUtf8String does not put result object in export set

The GCI function `GciNewUtf8String()` did not put the newly created object in the export set, which allowed it to be garbage collected while still in use. (#48217)

XFS file system errors for 32-bit processes

Some GemStone operations could error when run within 32-bit processes (such as 32-bit topaz RPC, or a 32-bit GCI application), on 64-bit XFS file system. Specifically, GsFile client file directory operations from 32-bit client processes for 32-bit client processes resulted in `EOverflow`. (#48462)

Issues affecting systems upgraded from early versions of GemStone

Repository scan errors on upgraded repositories

For a repository that originated in an early version of GemStone, and had fewer than 19 `GsObjectSecurityPolicies` (previously `Segments`), repository scan operations failed in v3.4 and later. (#48276)

objectAudit warnings on old 32-bit fanout in upgraded repositories

Repositories that were converted from 32-bit Gemstone/S and did not run `postconv` during that conversion, may have the older internal collection tree fanout. This is reported as a warning by `objectAudit`. This warning did not respect the `topaz push` command, and was only visible in the console, and thus was not always found. (#48277)

Current user SymbolList used instead of session SymbolList

As described in the *Programming Guide*, the transient and persistent `SymbolList`s have different functions. Several methods referred to the current User's `SymbolList`, where they should refer to the session `SymbolList`. (#48050)

The following methods have been updated:

```
GsNMethod >> _literalValToAssociations:  
SortedCollection >> resortAll:hiddenSetForErrors:
```

become: crashed with extremely large NSC

Sending `become:` to a million-item `UnorderedCollection` (Non-sequential collection), such as `IdentityBag`, could have crashed the Gem with a `SEGV`. (#48294)

RcKeyValueDictionary hard coded references to RcCollisionBucket

It is allowed to create customized collision buckets for a subclass of `RcKeyValueDictionary`; however, there were hardcoded references directly to `RcCollisionBucket`. These have been changed to invoke `_bucketClass`. (#48390)
